# Elements of a Successful Flight

- **Flight Prediction**
- **Setup and Ground Station Operations**
- **Coordination with FAA**
- **Launch**
- **Communications**
- **Tracking**
- **Recovery**
- ***Lunch***

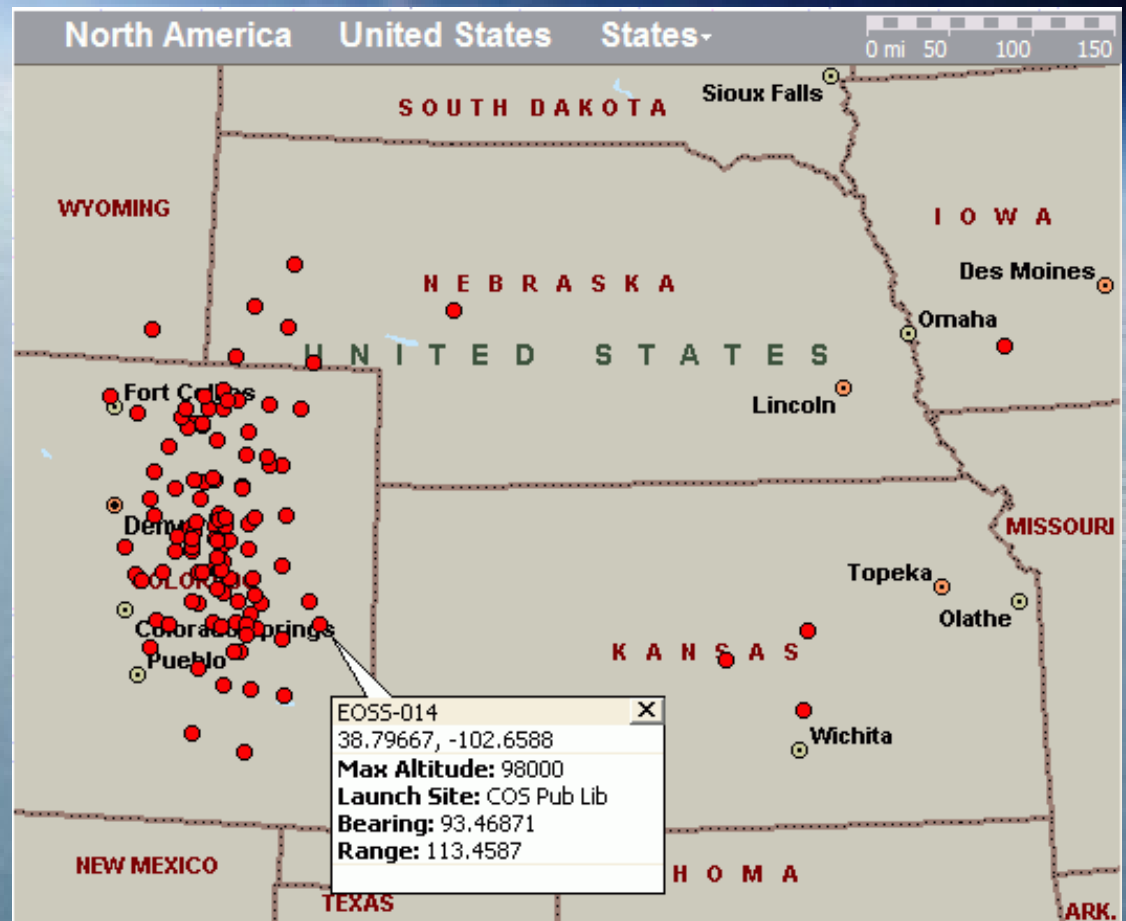

# Yeah? So what?

- **Amateur high altitude balloons go to “The Edge of Space” ...**
  - **Typical apogees of 100,000 ft MSL**
  - **Radio horizons of 400 miles**
  - **Above 99% of the Earth’s atmosphere**
  - **Too high for (most) aircraft or model rockets**
  - **Not really “space” (360,000+ ft MSL), but close enough for science and student experiments**

# EOSS History

- **EOSS-001 – November 18, 1990**
  - Robert Clement Park, Littleton, CO
- **EOSS-145 – August 1, 2009**
  - 100% recovery
- **EOSS-006**
  - May 30, 1992
  - 18 hours, 218 miles
- **Predictions**

# The Father of Amateur Radio Ballooning

- First ever ARHAB: Pauli OH2DV (Finland) May 1967
- Bill Brown WB8ELK's pioneering US flight August 15, 1987 from Findlay, OH carrying ATV & 2m FM transmitter.

- Rick von Glahn NØKKZ
  - Balloon Track for Windows
    - Implementation of several WB8ELK programs
    - Several additional elements

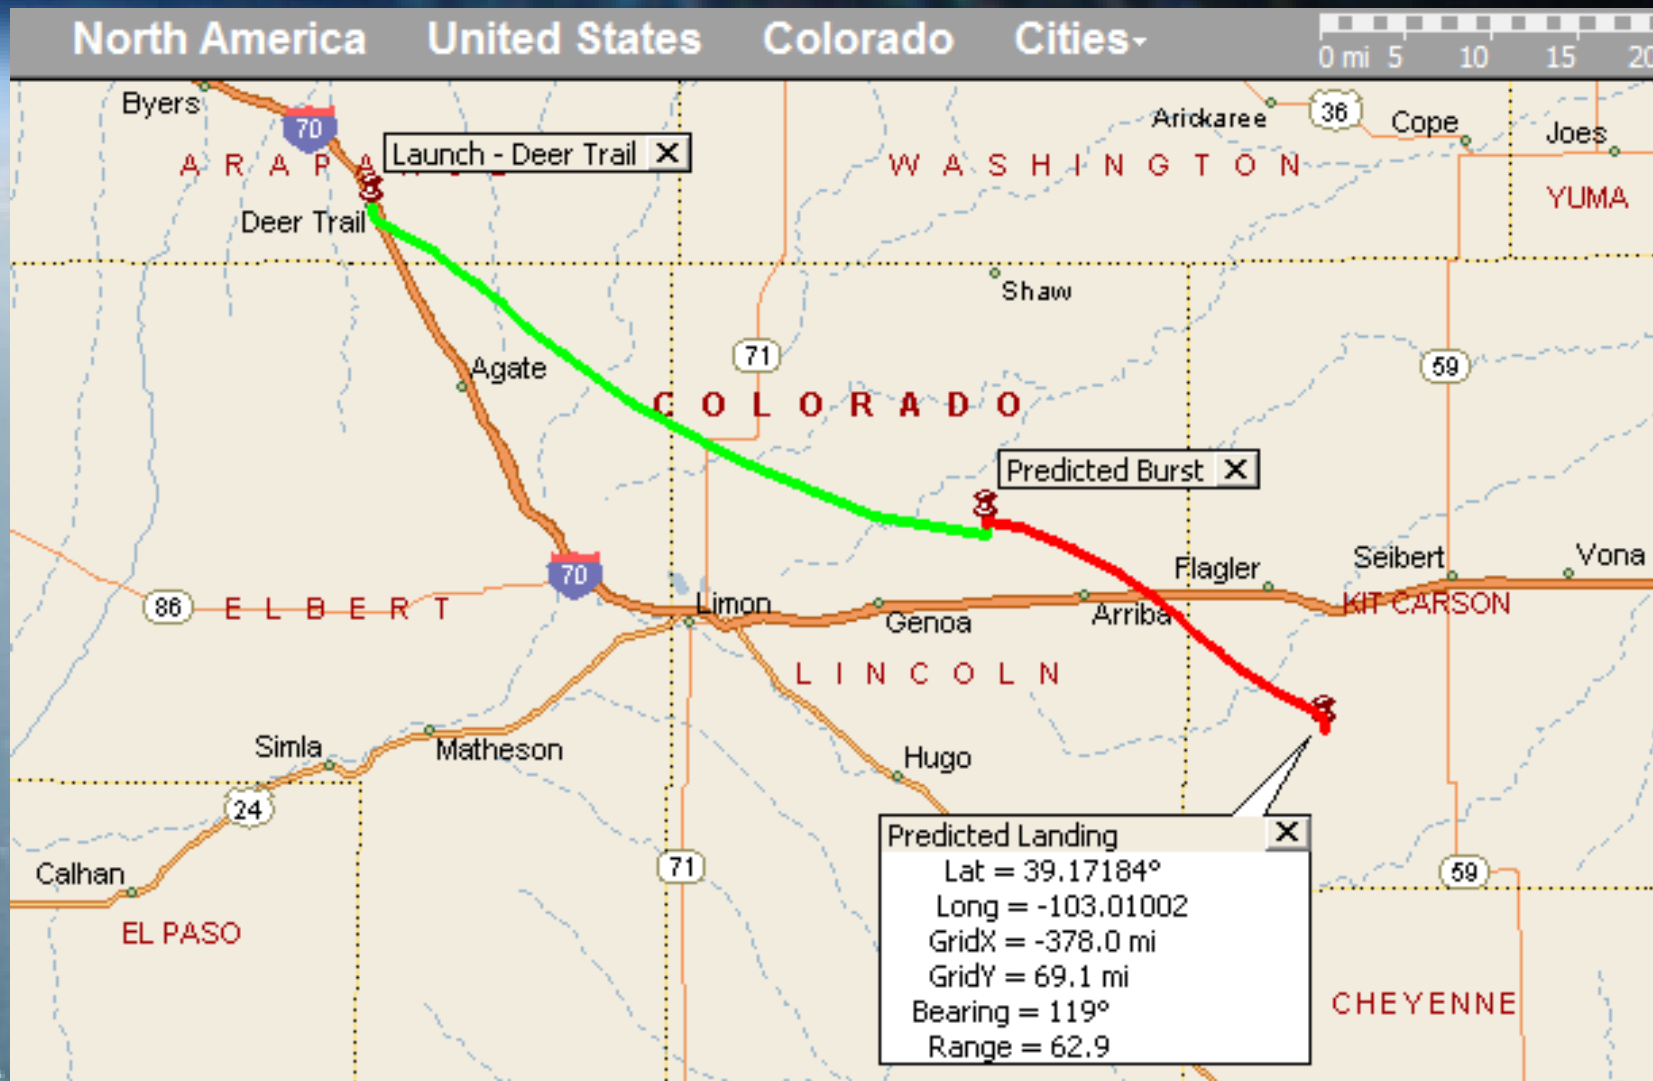

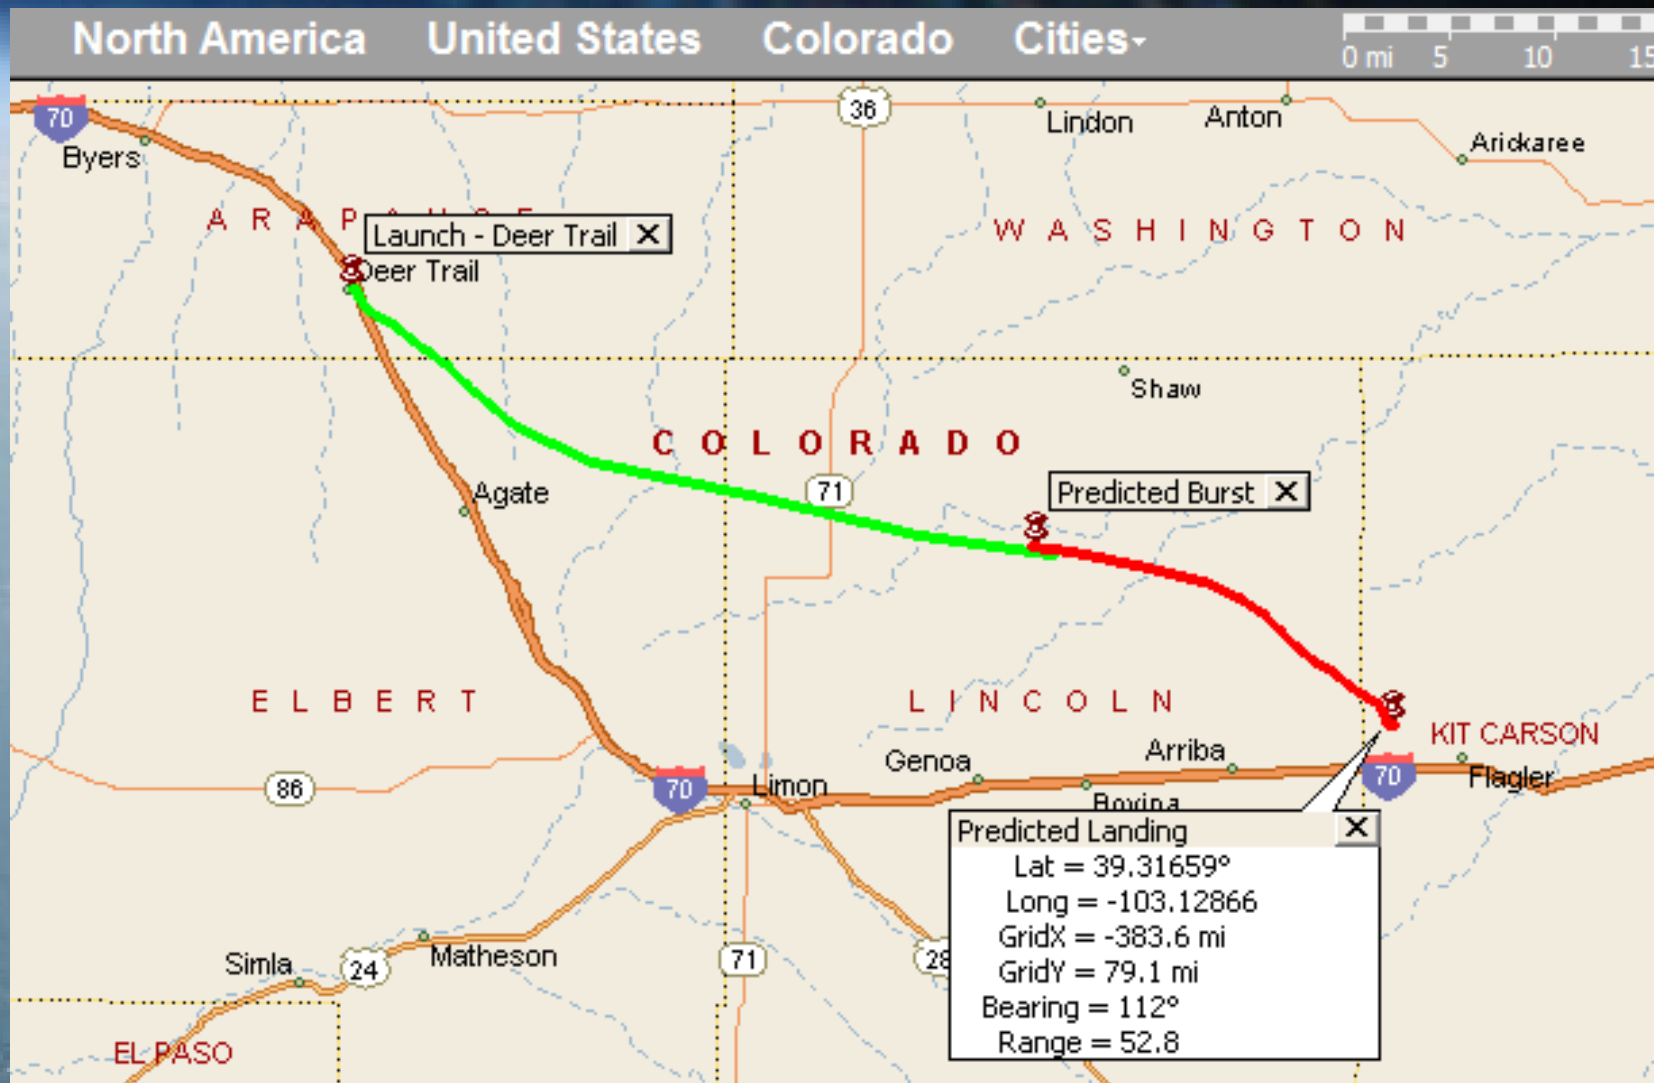

- 7 days

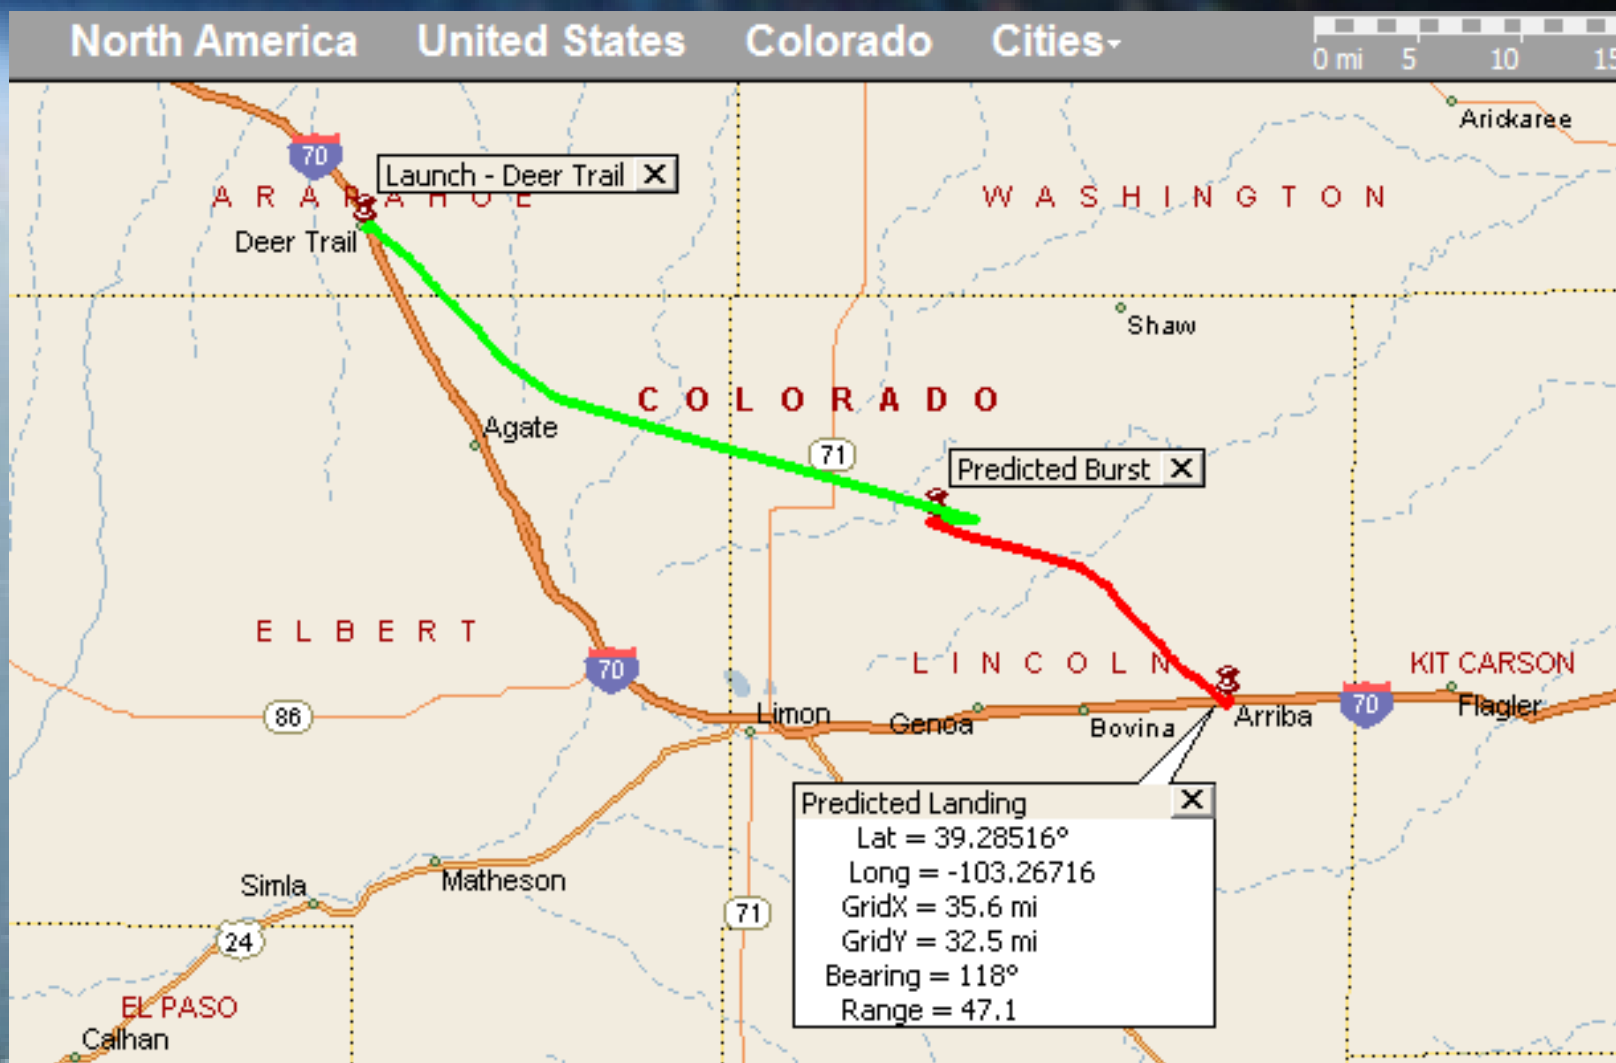

- 3 days

# APRS Module

# FAA Coordination

- **Exempt vs. FAA Regulated**
  - 12# total, 6# each piece max
- **Certificate of Waiver or Authorization**
  - Exempt from:
    - Radar reflector
    - 1.5 kW transponder beacon
  - Additional requirements (trade off)
    - Preflight notification
    - Internet tracking (dist & bearing from VORs)
    - Cutdown capability
- **We coordinate with FAA on all flights**

# Ground Station (Windsor)

# Launch Operation

# Tracking Operations

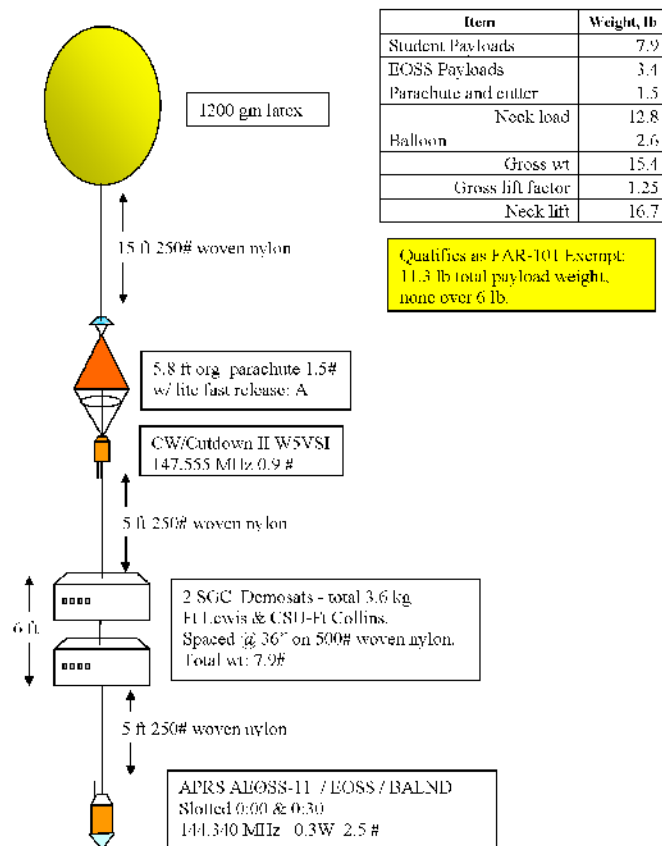

- **Breakfast meeting at 5:00 am !**
- **Pre-position around predicted landing site before launch**
- **Tracking Coordinator**
- **Each tracker is DF capable**
  - The only way before EOSS-21 !
  - Standard map and grid
- **Communications**
  - Wide area repeater
  - Simplex backup
- **Onboard APRS tracking**
  - Balloon and trackers
  - Digipeater on balloons
  - Non-standard frequency

# Tracking Operations

# Tracking Operations

Payload Plan      EOSS-145      1/2 Aug 2009 @ 0710  
Rev C – Final weights

EOSS-145\_Payload\_Plan\_C.doc

- DF Beacon 147.555 MHz
  - CW ID
  - 20 sec tone
  - 30 silence for cutdown receiver
- APRS 144.340 MHz
  - Time slotting (for multiple balloons)
  - GPS must work at altitude
    - Units that don't have:
      - Scud circuit
      - Self-limitations

# Foxhunter's heaven

- **Recovery is EOSS's "Prime Directive"**
  - 100% out of 145 flights in 19 years
  - First 20+ flights (and some since then) relied strictly on RDF
- Since going GPS/APRS, observing the landing is common!
- Even with GPS and APRS, final recovery often relies on DFing.
- with some occasional help from Air One (KCØRIA/AM)

# Recovery Operations

# Recovery Operations

# Even thru some “rough” landings!
